

NeuroEdge: Ambient Care Clinical Report

Patient: Arthur | Age: 78 | Condition: Parkinson's Disease

Report Generated: 2026-07-18 08:10

Reviewing Physician: Dr. Sarah Jenkins, Neurology

1. Acute Incident Alert: Fall Detected

AI Assessment: Emergency Services Dispatched

Automated Voice Triage Transcript:

AI: Arthur, I noticed you might have fallen. Are you okay? Where does it hurt?

PATIENT: my back is hurting so

AI: I am calling an ambulance right now, please stay still.

2. 30-Day Longitudinal Biomarkers (Ambient Tracking)

- Medication Adherence: 94% overall. Morning Levodopa doses delayed by >30 mins on 4 occasions.
- Voice Biomarkers: Progressive hypophonia detected. Average vocal amplitude decreased by 12% over 3 weeks.
- Motor Function (Gait): 15% increase in freezing of gait episodes, primarily between 07:00 and 09:00.
- Tremor Analysis: Amplitude increased by 8% in the left upper extremity during evening periods.
- Sleep Quality: Frequent nocturnal awakenings detected. Potential REM sleep behavior disorder indicators.

SYSTEM RECOMMENDATION:

Based on the recent fall and the longitudinal increase in freezing of gait, an early medication titration review is highly recommended before the next scheduled 6-month clinic visit.
